

Mechanism interpretation workflow: from prediction to conservative evidence boundary

The explanation layer prioritizes review targets without upgrading predictions to confirmed adverse-reaction evidence.

Current case-study outcome

Zhishi--diarrhoea: 11 nodes / 8 edges / 14 paths; top path drop 0.010074, but external evidence remains direction-conflicting.
Fragaria--altered-consciousness: one parsed path; top path drop 0.000021, so mechanism sensitivity is negligible.
Interpretation: useful for triage and hypothesis generation; insufficient for confirmed external validation or causal effect claims.
