

Mechanism interpretation workflow: from prediction to conservative evidence boundary

The explanation layer prioritizes review targets without upgrading predictions to confirmed adverse-reaction evidence.

Current final-checkpoint outcome

Formal PU-XMSAT checkpoint export completed for 10 folds; top-5000 final predictions were exported for mechanism screening.
Explicit-path coverage remains sparse: 391/5000 candidates; 20 mechanism-supported cases were perturbation-quantified.
Interpretation: checkpoint-aware triage with random controls; not SHAP, external validation, or causal evidence.
